

Amateur Radio Technician License Course

This course will introduce you to the fascinating world of amateur radio and will culminate in your obtaining the Technician Class Amateur Radio License (upon passing an FCC examination). Who has a ham radio license? Musicians, athletes, politicians, scientists (including Nobel laureates), physicians, and many others – whatever your educational background or interests, this hobby is for you! The skills you will learn in this course will help you for your studies in high school and beyond. We'll cover part of the high school physics curriculum. You'll learn how to have an extemporaneous conversation with someone you don't know – in a risk-free environment on the air. That skill will be important when you interview for jobs or educational opportunities. Lastly, having an amateur radio license is an uncommon achievement that you can highlight in college and scholarship applications.

In this course, you will learn how amateur radio plays a vital role in supporting emergency communications when natural disasters occur. You will also learn how amateur radio operators keep their skills sharp and have fun through contesting, building electronic equipment and just picking up the microphone and talking to people in different cities, states and countries. You will learn how to overcome microphone shyness and get some practical experience. The course will also cover the basic theory behind how radio waves are generated, how they propagate through the atmosphere, and how they are received on the other end. The basic electronic theory that is covered will be useful in high school and college physics courses. You will also learn how to set up a basic amateur radio station and how to operate it.

The Technician Amateur Radio License is your gateway into ham radio. Privileges include the entire VHF and UHF amateur radio spectrum (which is useful for local communication), long distance communication through satellites, digital voice communication (which is useful for internet-linked communication across the world) and parts of the HF (shortwave) spectrum (which is useful for direct radio communication around the world). Whether you are interested in building new equipment, meeting new people, a different way to build social skills, broadening your technical horizons or being prepared for an emergency where cell phones don't work well, this course is for you! Your instructor is an experienced amateur radio operator with 45 years in the hobby. The course is suitable for ages 10 (motivated and focused students) through adult. Prerequisites are basic arithmetic skills and a desire to learn. You can find out more about amateur radio at <https://www.arrl.org/what-is-ham-radio>.
